Drop a video file (MP4, M4V, MOV, WebM, MKV) to compress
Or choose a file from your device. This video compressor does not start an upload.

## About

Video Compressor Online is a video compressor that shrinks MP4 files in your browser without sending them to a server. It lets you choose either a percentage of the original size or a target number of megabytes, then creates a smaller MP4 download on your device. The tool also accepts M4V, MOV, WebM, and MKV inputs, but the output is a new MP4 file. Because compression happens locally, it is designed for private clips, meeting recordings, class videos, and other files you do not want uploaded.

## What is Video Compressor Online

Video Compressor Online is a video compressor built for people who want a smaller MP4 without using a remote upload queue. It runs in the browser, reads the selected file on your device, and creates a new MP4 download after processing. The app is centered on simple size control: you can choose a percentage or a target MB, and the compressor uses that goal to estimate a practical result.

This video compressor is not a general media editor. It is focused on shrinking video files, with MP4 as the output format and browser-side processing as the main privacy feature. The site says it accepts MP4, M4V, MOV, WebM, and MKV sources, which makes it useful when a clip arrives in a different container but needs to leave as an MP4.

## Key features

The core value of this video compressor is that it works locally instead of starting an upload. That matters when the file is private, large, or time-sensitive.

- Local processing in the browser, with no server upload step.
- Percentage-based compression for quick size reduction planning.
- Target MB input for situations where a form, email attachment, or app has a size limit.
- MP4 output, even when the input file is M4V, MOV, WebM, or MKV.
- Sample file support, so you can try the video compressor before using your own clip.
- A linked percentage and MB control, which keeps the estimate aligned as you adjust one field.
- Offline-friendly reuse after the first visit, because the app shell and video engine can be cached.

The page also explains that the compressor aims for an approximate size rather than an exact one. That is a useful detail for a video compressor: the final MP4 depends on duration, resolution, motion, and the chosen percentage.

## How to use it

Using this video compressor takes only a few steps, and the interface is built around one-page flow.

- Choose a local video file from your device or drop it into the page.

Start compression in the browser tab.

Download the new MP4 file when the process finishes.

If the file is still too large, lower the percentage and run the video compressor again.

A practical way to use the tool is to start with the size limit you actually need. If you are preparing an email attachment, aim below the limit so the message body and any extra files still fit. If you are using a form that rejects large clips, set the target MB slightly under the posted cap rather than trying to hit it exactly.

The app also shows example use cases such as email attachments, chat messages, and social uploads. Those examples are a clue that the video compressor is meant for quick resizing, not detailed encoding work.

## Who it is for

This video compressor is a good fit for anyone who needs a smaller MP4 quickly and wants to keep the file on their own machine.

People sending meeting recaps, class recordings, or walkthroughs by email.

Users who need to meet upload limits in school, hiring, support, or government forms.

People sharing short clips in messaging apps and want an MP4 that is easier to send.

Creators moving videos from desktop to phone or posting a smaller copy to social platforms.

Anyone who prefers browser-based compression over a desktop app or cloud converter.

It is especially relevant when privacy matters. Because the compressor reads the file locally, private footage does not need to leave the browser before the smaller MP4 is created.

## What to know before you use it

This video compressor is useful, but it has real limits that matter when you need predictable results.

The result is approximate, not exact. A target MB value is a guide, not a guarantee.

The final size depends on video length, resolution, and motion, so two clips with the same starting size can compress differently.

If you need frame-accurate editing, subtitles, trimming, or format conversion beyond MP4 export, this tool is not the right choice.

If a website or institution requires a specific file format, resolution, or bitrate, you should follow the official upload rules instead of relying only on the compressor estimate.

For highly sensitive material, local browser processing is a privacy benefit, but you should still use an official source or approved workflow when a policy mandates one.

The app's browser-first design is the main reason to use it, but it is also why you should treat the output as a practical smaller MP4 rather than a professionally tuned transcode. For quick size reduction, it does the job well; for strict technical requirements, verify the result before sending the file.

Video Compressor Online is best when you need a small MP4 fast, want to avoid uploading private footage, and care more about a useful output size than perfect encoding control. If that is your goal, this video compressor is a straightforward way to compress locally and download a smaller MP4.
